

Exam Logical Verification

December 18, 2008

There are six (6) exercises.

Answers may be given in Dutch or English. Good luck!

Exercise 1. This exercise is concerned with first-order propositional logic (prop1) and simply typed λ -calculus ($\lambda \rightarrow$).

- a. Give a proof in prop1 showing that the following formula is a tautology:

$$((B \rightarrow A \rightarrow B) \rightarrow A) \rightarrow A$$

(5 points)

- b. Give the type-derivation in $\lambda \rightarrow$ corresponding to the proof in 1a.

(5 points)

- c. Complete the following simply typed λ -terms:

$$\begin{aligned} \lambda x : ?. \lambda y : ?. \lambda z : ?. x \ z \ y \\ \lambda x : ?. \lambda y : ?. \lambda z : ?. x \ (z \ y) \\ \lambda x : ?. \lambda y : ?. ((\lambda u : ?. x \ u \ u) \ y) \end{aligned}$$

(5 points)

Exercise 2. This exercise is concerned with first-order predicate logic (pred1) and λ -calculus with dependent types (λP).

- a. Give a proof in pred1 showing that the following formula is a tautology:

$$\forall x. (P(x) \rightarrow (\forall y. P(y) \rightarrow A) \rightarrow A)$$

(5 points)

- b. Give the λP -term corresponding to the formula in 2a.

(5 points)

- c. Give a closed inhabitant in λP of the answer to 2b.

(5 points)

Exercise 3. This exercise is concerned with second-order propositional logic (prop2) and polymorphic λ -calculus ($\lambda 2$).

- a. Give a proof in prop2 showing that the following formula is a tautology:

$$(\forall c. (a \rightarrow b \rightarrow c) \rightarrow a) \rightarrow a$$

(5 points)

- b. Give the $\lambda 2$ -type corresponding to the formula of 3a.

(5 points)

- c. Give a closed inhabitant in $\lambda 2$ of the answer to 3b.

(5 points)

Exercise 4. This exercises is concerned with encodings.

- a. Give an definition of *false* in prop2 and show that the elimination rule for *false* (stating that from *false* follows any proposition) can be derived.

(5 points)

- b. We define *and* $A B$ in $\lambda 2$ as follows:

$$\text{and } A B := \Pi c : *. (A \rightarrow B \rightarrow c) \rightarrow c$$

Assume an inhabitant $P : \text{and } A B$. Give an inhabitant of A , assuming $A : *$.

(5 points)

- c. The datatype of natural numbers is encoded in $\lambda 2$ as

$$\text{Nat} := \Pi a : *. a \rightarrow (a \rightarrow a) \rightarrow a$$

Give two different inhabitants in $\lambda 2$ of this type.

(5 points)

Exercise 5. This definition is concerned with inductive datatypes.

- a. Give the definition of an inductive datatype with exactly three elements.

(5 points)

- b. Give the definition of an inductive datatype with zero elements.

(5 points)

- c. Give the type of the term `natlist_ind`, which gives the induction principle for finite lists of natural numbers.

(5 points)

Exercise 6. This exercise is concerned with inductive predicates.

- a. Consider the inductive definition of the predicate `le`:

```
Inductive le (n:nat) : nat -> Prop :=  
| le_n : le n n  
| le_S : forall m:nat , le n m -> le n (S m) .
```

Give an inhabitant of `le 0 (S 0)`.

(5 points)

- b. Consider the inductive definition of the predicate `palindrome`:

```
Inductive palindrome : natlist -> Prop :=  
| palindrome_zero :  
  palindrome nil  
| palindrome_one :  
  forall n:nat, palindrome (cons n nil)  
| palindrome_more :  
  forall n:nat, forall k l : natlist,  
  (palindrome l) -> (without_last n k l) -> palindrome (cons n k).
```

How do you write *the list consisting of only 1 is a palindrome*?

(5 points)

- c. Give an inhabitant of your answer to 6(b).

(5 points)

The final note is (the total amount of points plus 10) divided by 10.
